

# CDC Disinfection Guide for COVID-19 Vaccination Clinics

Clean surfaces and devices that are touched often whenever visibly soiled and periodically during while the clinic is in operation, e.g. mid- and end of day

- Examples are computer keyboards, registration table work surface/patient check in, clipboards, pens, etc.

Provide chairs for recipients during administration of vaccine and for the post-vaccine waiting period

**Important:**

- All vaccinations should be administered while a patient is sitting or lying down
- Chairs only need to be disinfected if visibly soiled and at the end of the vaccine clinic day of operation
- Chairs do not need to be disinfected after each use
